### Claims

1. - 66. (canceled)

67. (new) A computer-implemented method comprising:

receiving multiple sets of reference decoder parameters provided for given video,  
wherein each of the multiple sets comprises a rate parameter and a decoder buffer size  
parameter;

determining an operating condition using any of the multiple sets, wherein the operating  
condition indicates peak rate or decoder buffer size for decoding encoded data for the given  
video, and wherein the multiple sets are concurrently available for use in the determining the  
operating condition; and

at a decoder, receiving and decoding the encoded data for the given video in accordance  
with the operating condition.

68. (new) The method of claim 67 wherein the decoder buffer size parameter for each of  
the multiple sets is different.

69. (new) The method of claim 67 wherein the rate parameter for each of the multiple  
sets is different.

70. (new) The method of claim 67 wherein the decoder performs the determining.

71. (new) The method of claim 67 further comprising:

receiving multiple additional sets of reference decoder parameters;  
re-determining the operating condition using any of the multiple additional sets; and  
at the decoder, receiving and decoding the encoded data for the given video in  
accordance with the re-determined operating condition.

72. (new) The method of claim 67 further comprising receiving a number parameter that  
indicates how many sets of reference decoder parameters are provided for the given video.

JSG:cf 03/10/06 491219.doc 160205.01  
PATENT

Attorney Reference Number 3382-68270-01  
Application Number 09/955,731

73. (new) The method of claim 67 wherein the determining comprises selecting a parameter of one of the multiple received sets.

74. (new) The method of claim 67 wherein the determining comprises interpolating between parameters of two of the multiple sets.

75. (new) The method of claim 67 wherein the determining comprises extrapolating from a parameter of one of the multiple sets.

76. (new) The method of claim 67 wherein the peak rate is minimum peak rate, and wherein the determining comprises setting the minimum peak rate based upon one or more of the decoder buffer size parameters of the multiple sets.

77. (new) The method of claim 67 wherein the determining comprises setting the decoder buffer size based upon one or more of the rate parameters of the multiple sets.

78. (new) The method of claim 67 wherein the multiple sets are provided in a stream header for the given video.

79. (new) The method of claim 67 wherein the multiple sets are provided out-of-band for the given video.

80. (new) The method of claim 67 wherein each of the multiple sets further comprises an initial buffer fullness parameter.

81. (new) The method of claim 67 wherein each of the multiple sets represents a different leaky bucket model for the given video.

82. (new) The method of claim 67 wherein each of the multiple sets represents a different point along a rate-decoder buffer size curve for the given video.

JSG:cf 03/10/06 491219.doc 160205.01  
PATENT

Attorney Reference Number 3382-68270-01  
Application Number 09/955,731

83. (new) The method of claim 67 wherein the given video is an entire video sequence.
84. (new) The method of claim 67 wherein the given video is part of a video sequence.
85. (new) The method of claim 67 wherein the decoder is implemented in a handheld computing device.
86. (new) The method of claim 67 wherein the decoder is implemented in a personal computer.
87. (new) The method of claim 67 wherein the decoder is implemented in a disk media player.
88. (new) The method of claim 67 wherein the peak rate corresponds to a drive speed for a disk drive during the decoding the encoded data.
89. (new) The method of claim 67 wherein the peak rate corresponds to a transmission rate for a network connection during the decoding the encoded data.
90. (new) The method of claim 67 wherein the decoding the encoded data occurs during live video transmission for the given video.
91. (new) The method of claim 67 wherein the decoding the encoded data occurs during on-demand transmission for the given video.
92. (new) A computer-implemented method comprising:  
receiving multiple sets of reference decoder parameters signaled for given video of a single video bit stream, wherein each of the multiple sets comprises a rate parameter and a decoder buffer size parameter; and

JSG:cf 03/10/06 491219.doc 160205.01  
PATENT

Attorney Reference Number 3382-68270-01  
Application Number 09/955,731

processing the multiple sets, wherein the multiple sets are concurrently available for use in determination of an operating condition, and wherein the operating condition indicates peak rate or decoder buffer size for decoding encoded data for the given video.

93. (new) The method of claim 92 wherein the decoder buffer size parameter for each of the multiple sets is different.

94. (new) The method of claim 92 wherein the rate parameter for each of the multiple sets is different.

95. (new) The method of claim 92 further comprising receiving a number parameter that indicates how many sets of reference decoder parameters are signaled for the given video.

96. (new) The method of claim 92 further comprising:  
receiving multiple additional sets of reference decoder parameters signaled for the given video of the single video bit stream;  
processing the multiple additional sets, wherein the multiple additional sets are concurrently available for use in re-determination of the operating condition.

97. (new) The method of claim 92 wherein the multiple sets are signaled out of band.

98. (new) The method of claim 92 wherein the processing comprises reading the multiple sets from a stream header of the single video bit stream.

99. (new) The method of claim 92 wherein the processing comprises determining the operating condition.

100. (new) The method of claim 92 wherein each of the multiple sets further comprises an initial buffer fullness parameter.

JSG:cf 03/10/06 491219.doc 160205.01  
PATENT

Attorney Reference Number 3382-68270-01  
Application Number 09/955,731

101. (new) The method of claim 92 wherein each of the multiple sets represents a different leaky bucket model for the given video.

102. (new) The method of claim 92 wherein each of the multiple sets represents a different point along a rate-decoder buffer size curve for the given video.

103. (new) The method of claim 92 wherein the given video is part of a video sequence.

104. (new) The method of claim 92 wherein the peak rate corresponds to a drive speed for a disk drive during the decoding the encoded data.

105. (new) The method of claim 92 wherein the peak rate corresponds to a transmission rate for a network connection during the decoding the encoded data.

106. (new) The method of claim 92 wherein the decoding the encoded data occurs during live video transmission for the given video.

107. (new) The method of claim 92 wherein the decoding the encoded data occurs during on-demand transmission for the given video.

108. (new) A computer-implemented method comprising:  
receiving a number parameter that indicates how many sets of reference decoder parameters are signaled for given video of a single video bit stream;  
receiving multiple sets of reference decoder parameters signaled for the given video, wherein each of the multiple sets comprises a rate parameter and a decoder buffer size parameter, and wherein each of the multiple sets represents a different point along a rate-decoder buffer size curve for the given video; and  
processing the multiple sets, wherein the multiple sets are concurrently available for use in determination of an operating condition, and wherein the operating condition indicates peak rate or decoder buffer size for decoding encoded data for the given video.

JSG:ef 03/10/06 491219.doc 160205.01  
PATENT

Attorney Reference Number 3382-68270-01  
Application Number 09/955,731

109. (new) The method of claim 108 wherein the decoder buffer size parameter for each of the multiple sets is different, and wherein the rate parameter for each of the multiple sets is different.

110. (new) The method of claim 108 wherein the number parameter and the multiple sets are signaled out of band.

111. (new) The method of claim 108 wherein the processing comprises reading the multiple sets from a stream header of the single video bit stream.

112. (new) The method of claim 108 wherein the processing comprises determining the operating condition.

113. (new) The method of claim 112 wherein the determining comprises selecting a parameter of one of the multiple received sets, interpolating between parameters of two of the multiple sets, or extrapolating from a parameter of one of the multiple sets.

114. (new) The method of claim 112 wherein the peak rate corresponds to a drive speed for a disk drive during the decoding the encoded data.

115. (new) The method of claim 112 wherein the peak rate corresponds to a transmission rate for a network connection during the decoding the encoded data.

116. (new) The method of claim 112 wherein the decoding the encoded data occurs during on-demand transmission for the given video.

117. (new) A computer-implemented method comprising:  
receiving multiple sets of reference decoder parameters signaled for given video of a single video bit stream, wherein each of the multiple sets comprises a rate parameter and a decoder buffer size parameter;

JSG:ef 03/10/06 491219.doc 160205,01  
PATENT

Attorney Reference Number 3382-68270-01  
Application Number 09/955,731

processing the multiple sets, wherein the multiple sets are concurrently available for use in determination of an operating condition, and wherein the operating condition indicates peak rate or decoder buffer size for decoding encoded data for the given video;

receiving multiple additional sets of reference decoder parameters signaled for the given video of the single video bit stream; and

processing the multiple additional sets, wherein the multiple additional sets are concurrently available for use in re-determination of the operating condition, and wherein each of the multiple sets and multiple additional sets represents a different leaky bucket model for the given video.

118. (new) The method of claim 117 wherein the decoder buffer size parameter for each of the multiple sets is different, and wherein the rate parameter for each of the multiple sets is different.

119. (new) The method of claim 117 wherein the processing comprises determining the operating condition, and wherein the determining comprises selecting a parameter of one of the multiple received sets, interpolating between parameters of two of the multiple sets, or extrapolating from a parameter of one of the multiple sets.

120. (new) The method of claim 117 wherein the processing comprises determining the operating condition, and wherein the determining comprises setting the peak rate based upon one or more of the decoder buffer size parameters of the multiple sets or setting the decoder buffer size based upon one or more of the rate parameters of the multiple sets.

121. (new) A computer-implemented method comprising:

receiving a number parameter that indicates how many sets of reference decoder parameters are provided for given video;

receiving multiple sets of reference decoder parameters provided for the given video, wherein each of the multiple sets comprises a rate parameter and a decoder buffer size parameter;

JSG:cf 03/10/06 491219.doc 160205.01  
PATENT

Attorney Reference Number 3382-68270-01  
Application Number 09/955,731

determining an operating condition using any of the multiple sets, wherein the operating condition indicates peak rate or decoder buffer size for decoding encoded data for the given video, wherein the multiple sets are concurrently available for use in the determining the operating condition, and wherein each of the multiple sets represents a point along a rate-decoder buffer size curve for the given video; and

at a decoder, receiving and decoding the encoded data for the given video in accordance with the operating condition.

122. (new) The method of claim 121 wherein the decoder buffer size parameter for each of the multiple sets is different, and wherein the rate parameter for each of the multiple sets is different.

123. (new) The method of claim 121 wherein the number parameter and the multiple sets are provided in a stream header for the given video.

124. (new) The method of claim 121 wherein the number parameter and the multiple sets are provided out-of-band for the given video.

125. (new) The method of claim 121 wherein the determining comprises selecting a parameter of one of the multiple received sets, interpolating between parameters of two of the multiple sets, or extrapolating from a parameter of one of the multiple sets.

126. (new) The method of claim 121 wherein the decoder is implemented in a handheld computing device, in a personal computer, or in a disk media player.

127. (new) The method of claim 121 wherein the decoding the encoded data occurs during on-demand transmission for the given video.

128. (new) A system comprising:

JSG:cf 03/10/06 491219.doc 160205.01  
PATENT

Attorney Reference Number 3382-68270-01  
Application Number 09/955,731

one or more modules for receiving multiple sets of reference decoder parameters signaled for given video of a single video bit stream, wherein each of the multiple sets comprises a rate parameter and a decoder buffer size parameter; and

one or more modules for processing the multiple sets, wherein the multiple sets are concurrently available for use in determination of an operating condition, and wherein the operating condition indicates peak rate or decoder buffer size for decoding encoded data for the given video.

129. (new) The system of claim 128 wherein the decoder buffer size parameter for each of the multiple sets is different, and wherein the rate parameter for each of the multiple sets is different.

130. (new) The system of claim 128 wherein the processing comprises determining the operating condition.

131. (new) The system of claim 130 wherein the determining comprises selecting a parameter of one of the multiple received sets, interpolating between parameters of two of the multiple sets, or extrapolating from a parameter of one of the multiple sets.

132. (new) A computer-readable medium storing computer-executable instructions for causing a computer system programmed thereby to perform a method comprising:

receiving multiple sets of reference decoder parameters signaled for given video of a single video bit stream, wherein each of the multiple sets comprises a rate parameter and a decoder buffer size parameter; and

processing the multiple sets, wherein the multiple sets are concurrently available for use in determination of an operating condition, and wherein the operating condition indicates peak rate or decoder buffer size for decoding encoded data for the given video.
